

THERMOSEAL

October 2012

Thermoseal now offers “Stepped, or Offset” Insulating Glass (IG) units! Thermoseal is the first North American Insulating Glass Company to produce Stepped IG units that are manufactured on a totally automated production line. Stepped or offset IG units typically consist of double or triple-glazed IG units where the outer lite of glass is larger than the inner lite of glass (in a double-glazed IG) or both inner lites of glass (in a triple-glazed IG).

Stepped IGs offer a means to enlarge the exterior glass surface area of refrigerators by incorporating the perimeter of the IG unit as part of the structural glazing component of the door system. Stepped IGs are also a common feature in architectural and commercial glazing applications.

Contact Thermoseal today to find out if Stepped IGs can help you market your glass products.
